

Determination of Higgs Couplings at the LHC

Michael Rauch

Institut für Theoretische Physik

Universität Karlsruhe

(in collaboration with Michael Dührssen, Rémi Lafaye, Tilman Plehn, Dirk Zerwas)

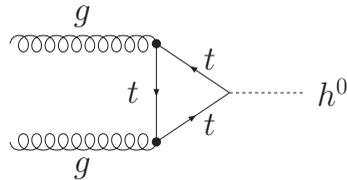

Outline

- Production and Decay of Higgs Bosons
- Analysis of Effective Higgs Couplings
- Supersymmetric Scenario
- Combining Poisson and Gaussian Errors
- Determination of Errors on Couplings

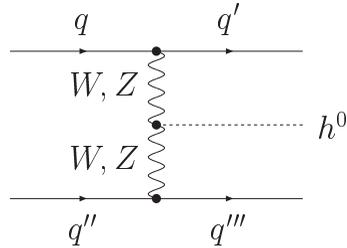

Production Modes

Main Higgs-boson production modes:

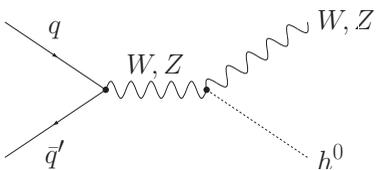

- **Gluon-Gluon Fusion**

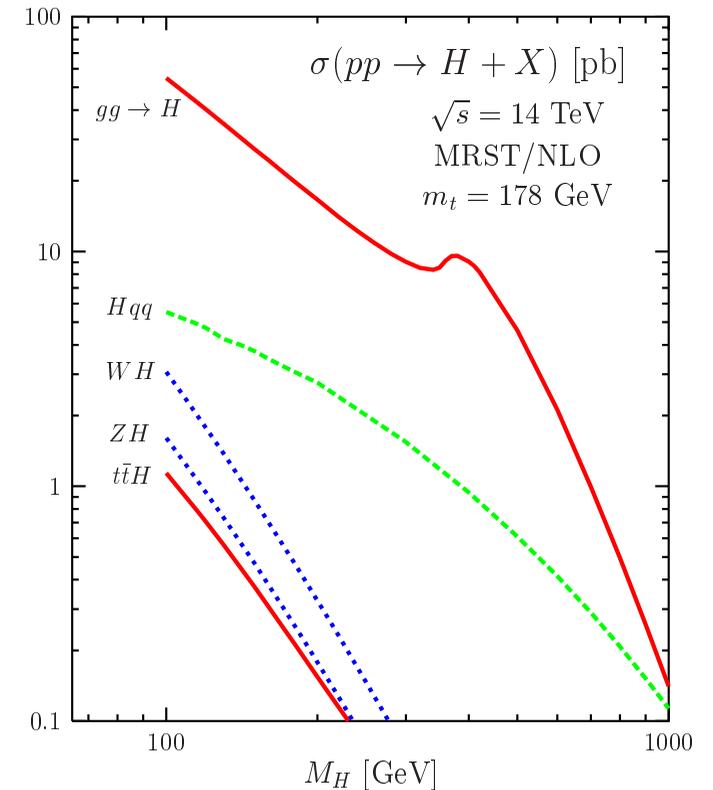

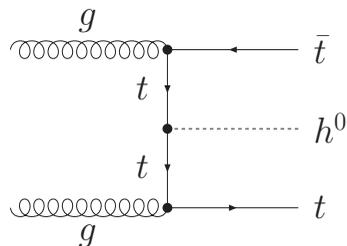

- **Vector-Boson Fusion**

- **Associated Production with a Gauge Boson**

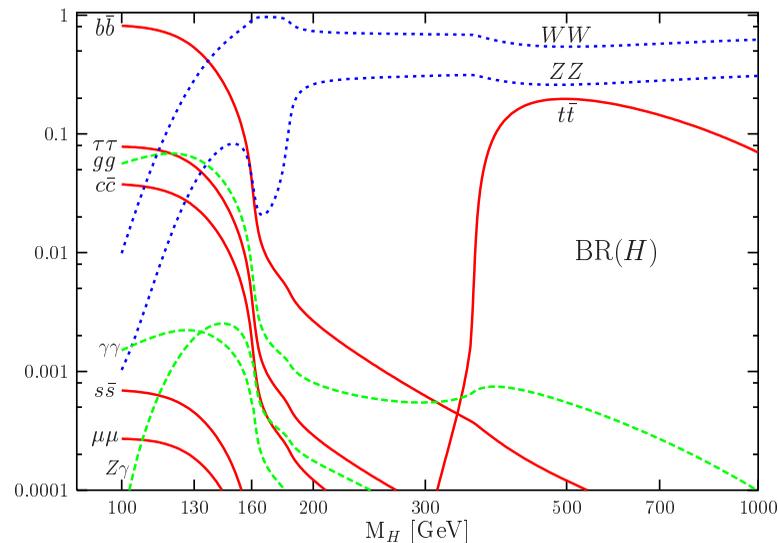

- **Associated Production with Top-Quark–Antiquark Pair**

Higgs-Boson Decays

● $H \rightarrow b\bar{b}$

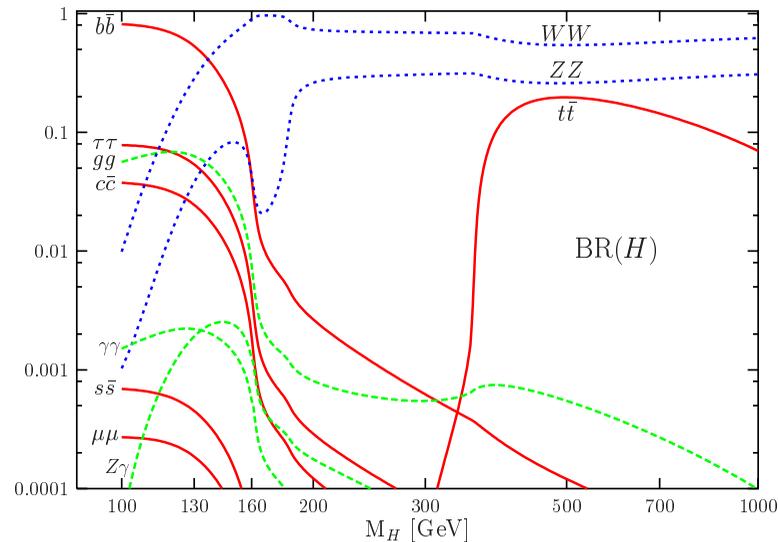

- Main decay mode ($\sim 90\%$) for light Higgs bosons, as suggested by electroweak precision data
- Hard to extract from QCD backgrounds
- Combination with ttH production difficult to observe because of combinatorial background (4 bottom quarks in final state)
- Recent suggestion of WH/ZH production plus jet substructure analysis looks promising

[CMS-TDR]

Higgs-Boson Decays

- $H \rightarrow b\bar{b}$
- $H \rightarrow WW$
 - Main decay mode for heavier Higgs bosons ($m_H \gtrsim 140$ GeV)
 - Two leptonic decays of the W allow only reconstruction of transverse mass of the WW pair
 - Gluon and vector-boson fusion relevant even if W s are off-shell

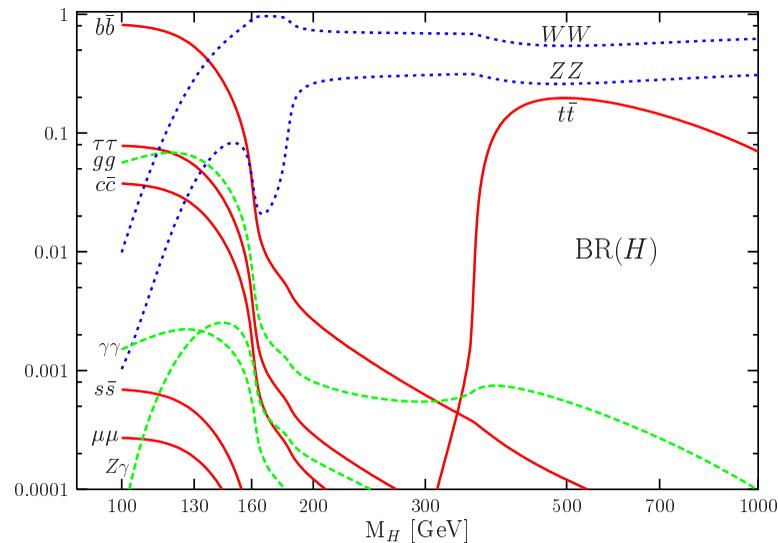

[CMS-TDR]

Higgs-Boson Decays

- $H \rightarrow b\bar{b}$
- $H \rightarrow WW$
- $H \rightarrow ZZ$
 - “Golden Channel” due to four-lepton final state
 - Statistically limited to larger Higgs masses
- $H \rightarrow \tau\tau$
 - Need to reconstruct invariant mass of the two taus
 - Limits production channel to vector-boson fusion
 - One of the discovery channels for light Higgs bosons

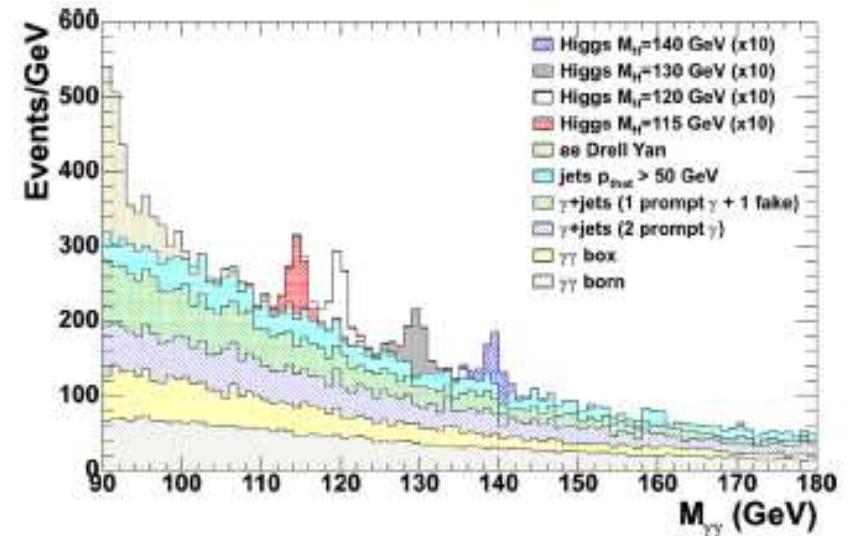

[Plehn, Rainwater, Zeppenfeld]

[CMS-TDR]

Higgs-Boson Decays

- $H \rightarrow b\bar{b}$
- $H \rightarrow WW$
- $H \rightarrow ZZ$
- $H \rightarrow \tau\tau$
- $H \rightarrow \gamma\gamma$
 - Loop-induced coupling by (mainly) W and t
 - Only fully reconstructable channel for a light Higgs boson
 - Small branching ratio ($\lesssim 0.2\%$)
 - Promising discovery channel for light Higgs bosons, background can be subtracted via sidebands
 - Higgs mass measurement up to 100 MeV

[CMS-TDR]

General Higgs Sector

- Theory: Standard Model plus general Higgs sector
- For Higgs couplings present in the Standard Model $j = W, Z, t, b, \tau$ replace general couplings by

$$g_{jjH} \longrightarrow g_{jjH}^{\text{SM}} (1 + \Delta_{jjH})$$

- For loop-induced Higgs couplings $j = \gamma, g$ replace by

$$g_{jjH} \longrightarrow g_{jjH}^{\text{SM}} \left(1 + \Delta_{jjH}^{\text{tree}} + \Delta_{jjH} \right)$$

where g_{jjH}^{SM} : (loop-induced) coupling in the Standard Model

$\Delta_{jjH}^{\text{tree}}$: contribution from modified tree-level couplings to Standard-Model particles

Δ_{jjH} : additional (dimension-five) contribution

- Additional free parameters:

- Higgs boson mass m_H
- Top-quark mass m_t
- Bottom-quark mass m_b

- Experimental input:

- ATLAS study on Higgs couplings

[Dührssen, references therein; ATLAS & CMS-TDR]

- Jet substructure analysis for $WH/ZH, H \rightarrow b\bar{b}$

[Butterworth, Davison, Rubin, Salam]

- Need to scan high-dimensional parameter space
- ⇒ SFitter
- General Higgs couplings from modified version of HDecay
- Three scanning techniques:
 - Weighted Markov Chain
 - Cooling Markov Chain (equivalent to simulated annealing)
 - Gradient Minimisation (Minuit)
- Output of SFitter:
 - Fully-dimensional log-likelihood map
 - Reduction to plotable one- or two-dimensional distributions via both
 - Bayesian (marginalisation) or
 - Frequentist (profile likelihood) techniques
 - List of best points

[Lafaye, Plehn, MR, Zerwas]

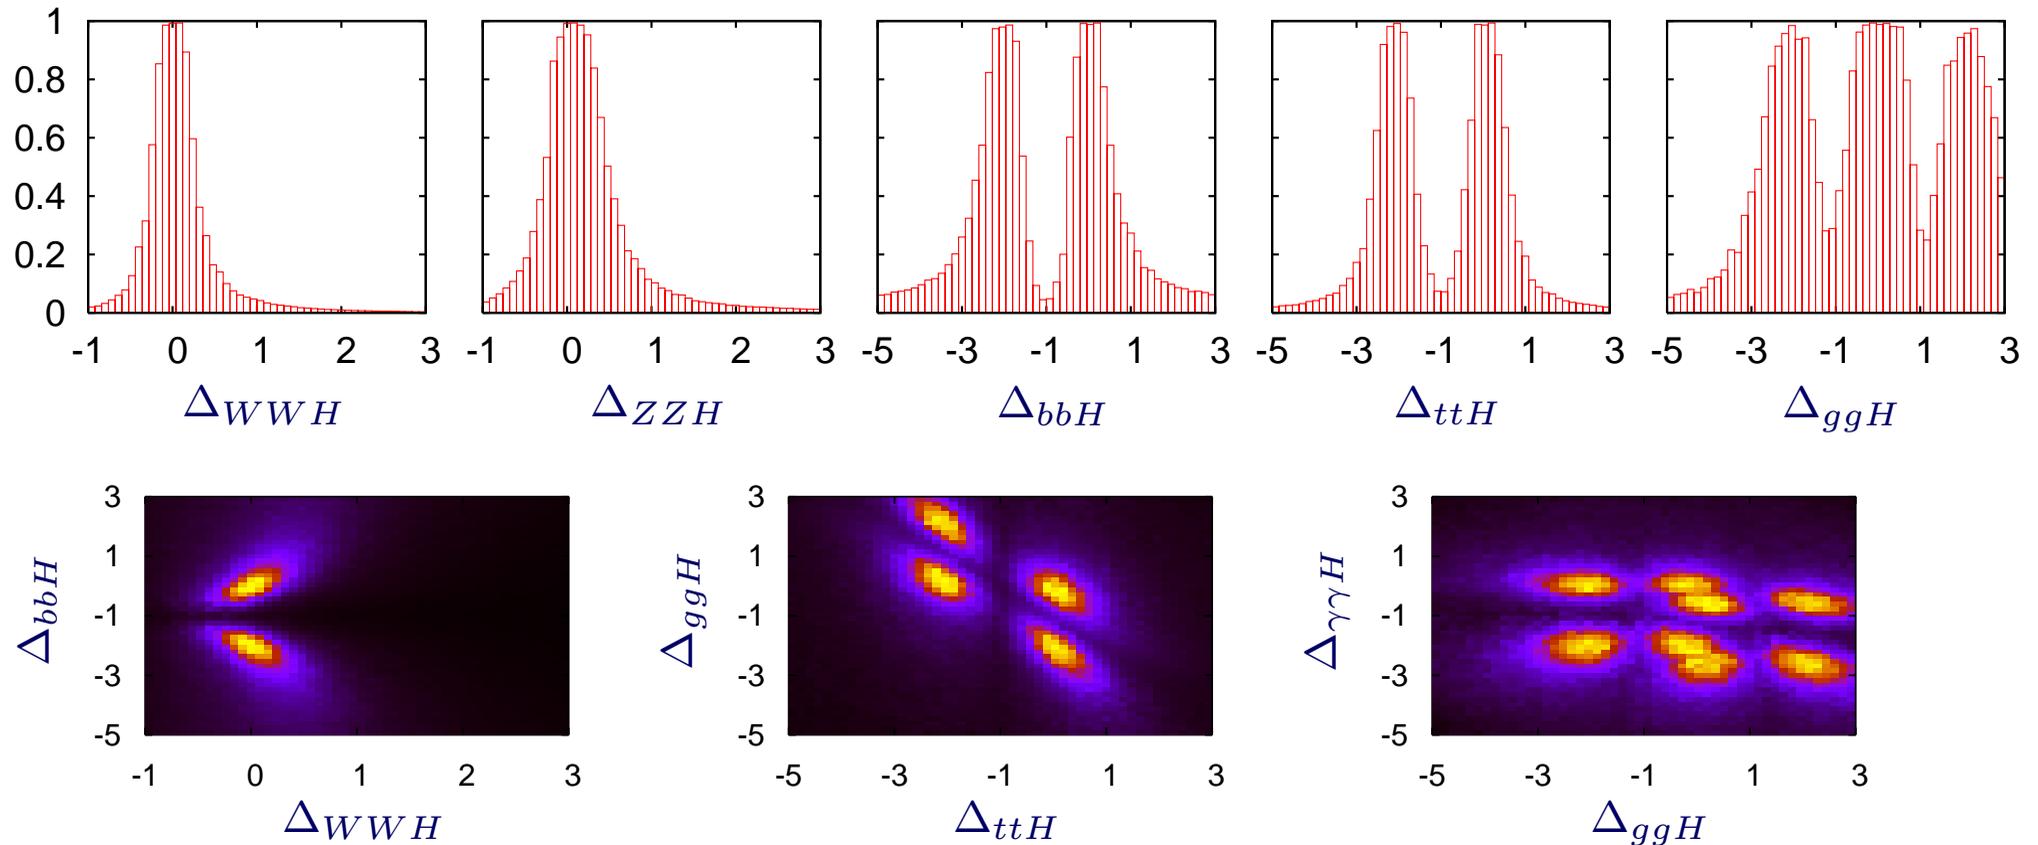

[Spira]

Results

LHC data set with 30 fb^{-1} , $m_H = 120 \text{ GeV}$, Profile likelihood

True data set

$1/\Delta\chi^2$

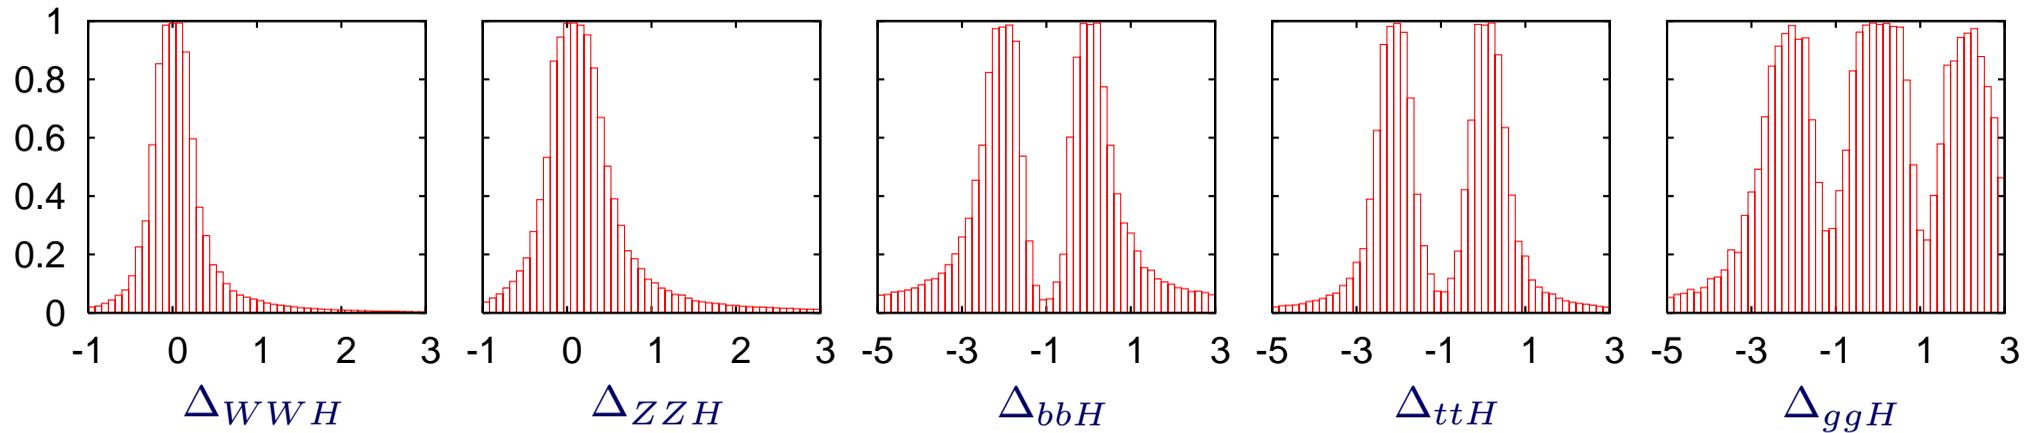

- Can reconstruct Standard Model solution, alternative solutions due to sign degeneracy
- See expected correlations (e.g. Δ_{ttH} vs Δ_{ggH})

Results

LHC data set with 30 fb^{-1} , $m_H = 120 \text{ GeV}$, Profile likelihood

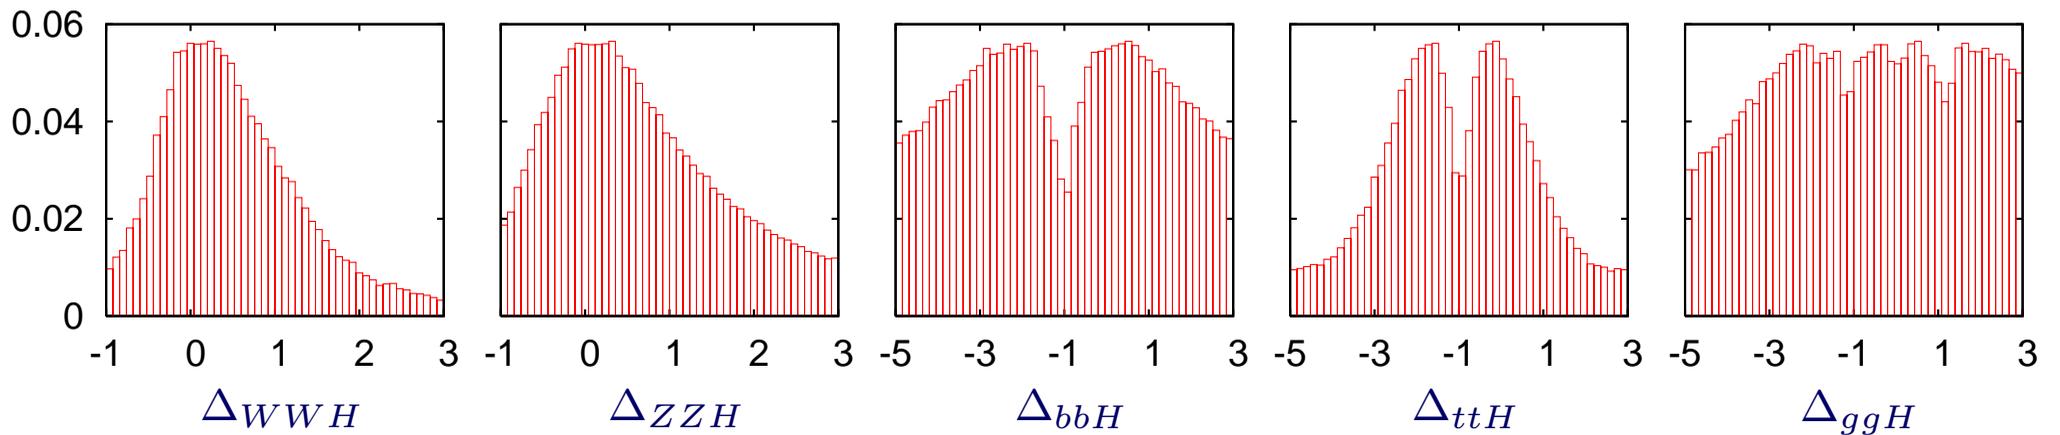

True data set

$1/\Delta\chi^2$

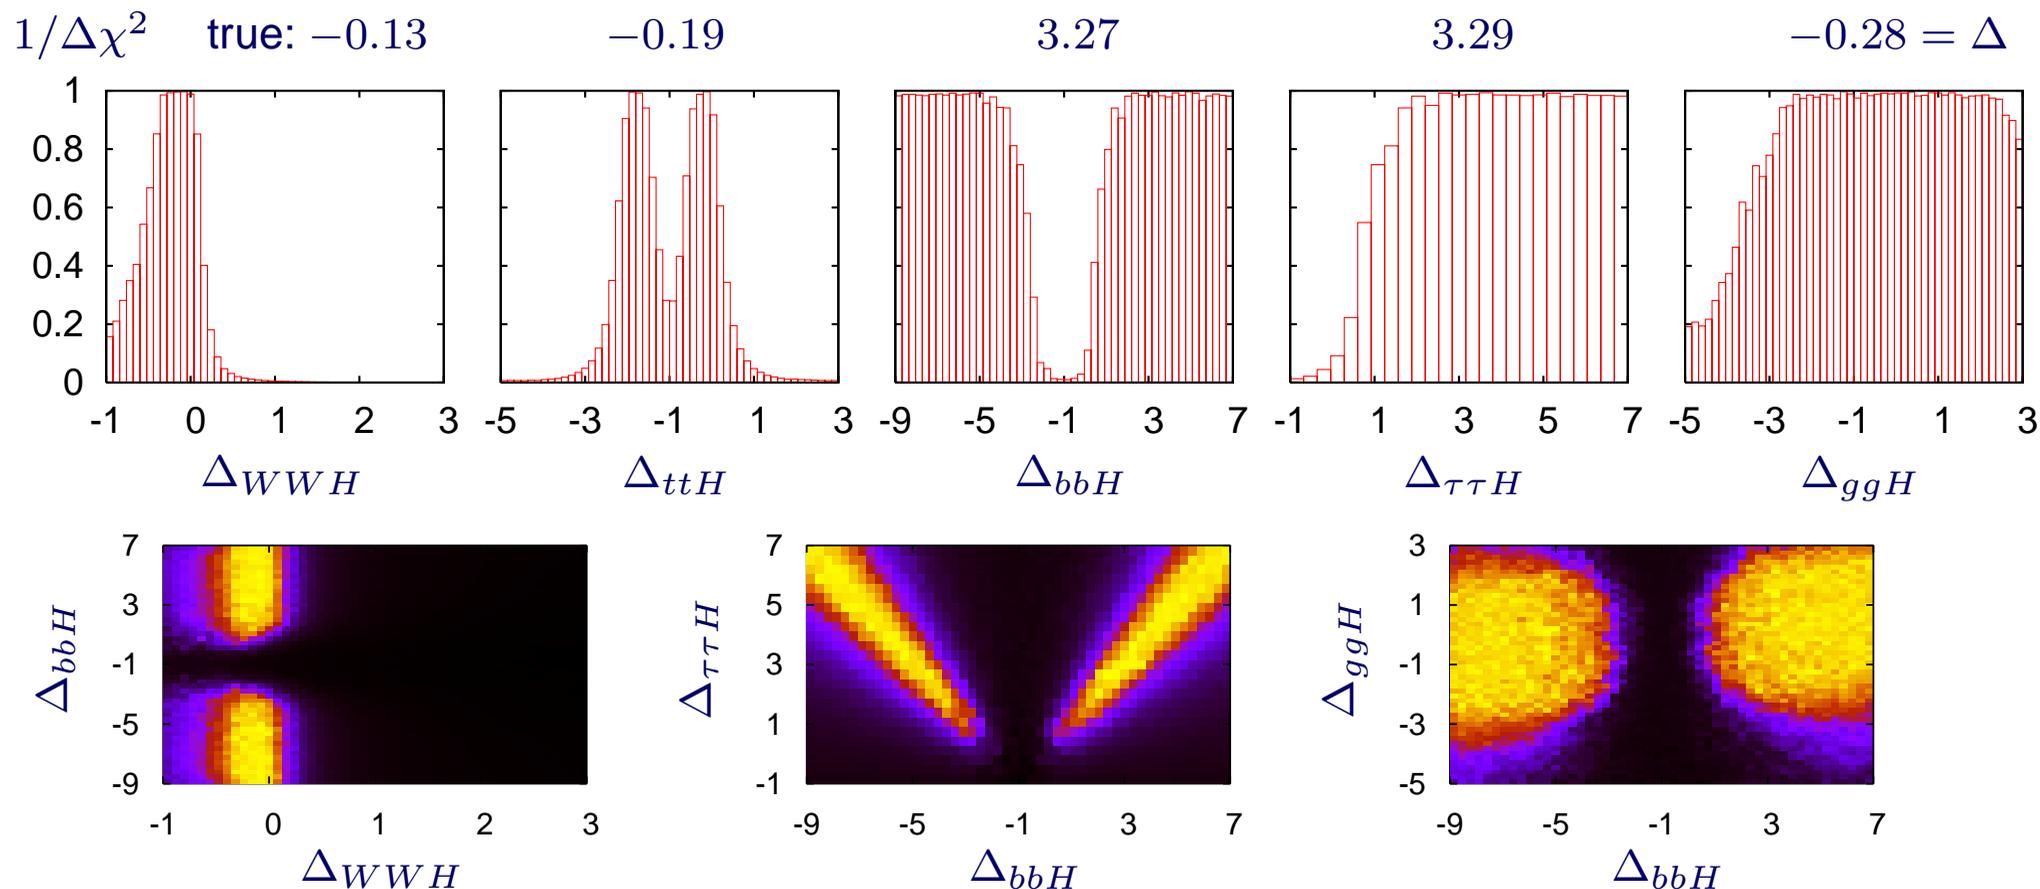

Smearred data set

$1/\Delta\chi^2$

Non-decoupling Supersymmetric Higgs

SPS1a-inspired scenario with $t_\beta = 7$, $A_t = -1100$ GeV, $m_A = 151$ GeV, $m_{h^0} = 120$ GeV
 LHC data set with 30 fb^{-1} , Profile likelihood, true data set

- Clear deviation from Standard Model: $\Delta\chi^2 = 444/18 \text{ dof} \hat{=} \text{CL} = 1 - 10^{-83}$
- Strong correlation between Δ_{bbH} and $\Delta_{\tau\tau H}$ via total width
- No upper limit on g_{bbH} as $BR \simeq 1$ compatible with data

Errors

- Statistical errors on individual channels of Poisson type
- Systematic errors (luminosity, tagging efficiency, . . .) extracted from large event samples
⇒ Gaussian
- Need to combine
 - Poisson $P_P(d, m) = \frac{\exp(-m)m^d}{\Gamma(d+1)}$ and
 - Gaussian $P_G(d, m, \sigma) = \frac{1}{\sqrt{2\pi}\sigma} \exp(-\frac{(d-m)^2}{2\sigma^2})$ errors
- Mathematically correct way: convolution
- No analytic solution, numerical integration too time-consuming
- ⇒ Approximate formula:

$$\frac{1}{\tilde{\chi}^2} \equiv \frac{1}{-2 \log L} = \sum_i \frac{1}{-2 \log L_i}$$

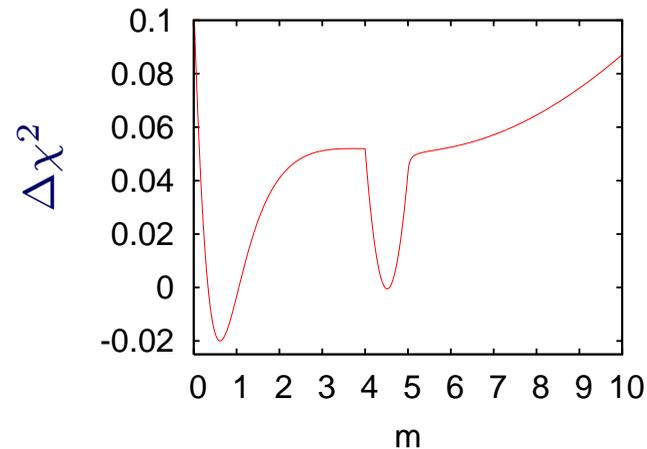

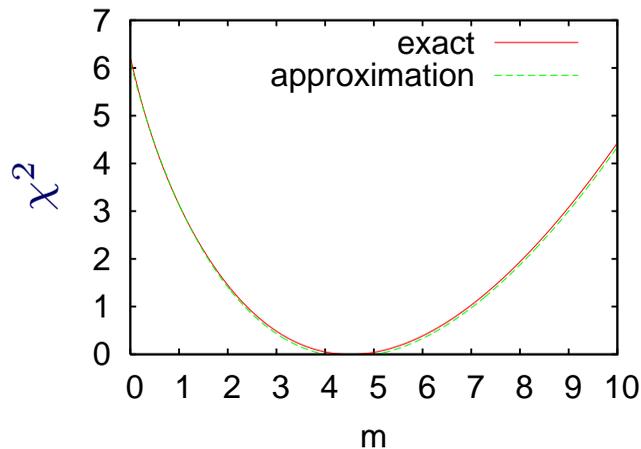

- Yields exact formula for Gaussian-only (adding errors in quadrature)
- Gives correct result when one error approaches 0 or ∞

Errors

- Approximate formula for Gauss and Poisson errors:

$$\begin{aligned}\frac{1}{\tilde{\chi}^2} &= \frac{1}{-2 \log L} = \sum_i \frac{1}{-2 \log L_i} \\ &\rightarrow \frac{1}{-2 \log L_P} + \frac{1}{-2 \log L_G} \\ &= \frac{1}{-2 \log P_P(d, m) / P_P(m, m)} + \frac{\sigma^2}{-2(d - m)^2}\end{aligned}$$

- Example: Poisson($d = 5$), Gauss($\sigma = 0.5$)

- \Rightarrow Very good agreement with exact convolution
- Difference almost always positive \Rightarrow slight overestimation of Higgs-coupling errors (good!)

Determination of errors on couplings

Determination of errors on Higgs couplings:

- Perform 10,000 toy experiments with measurements smeared around correct value
- Minimise each toy experiment
- Plot resulting distribution of parameter points and fit with Gaussian

	full measurements			only $t\bar{t}H, H \rightarrow b\bar{b}$		
	σ_{symm}	σ_{neg}	σ_{pos}	σ_{symm}	σ_{neg}	σ_{pos}
m_H	± 0.25	-0.26	$+0.25$	± 0.25	-0.26	$+0.25$
$\Delta_{b\bar{b}H}$	± 0.44	-0.30	$+0.59$	± 0.78	-0.43	$+0.84$
Δ_{WWH}	± 0.24	-0.21	$+0.27$	± 0.33	-0.24	$+0.43$
$\Delta_{\tau\bar{\tau}H}$	± 0.31	-0.19	$+0.46$	± 0.39	-0.20	$+0.60$
Δ_{ggH}	± 0.61	-0.59	$+0.62$	± 0.66	-0.48	$+0.82$

- Can determine all couplings with good accuracy
- Subjet analysis crucial for precise determination of $g_{b\bar{b}H}$
Without this additional peak at $g_{b\bar{b}H} = 0$ (not fitted above)
- Accuracy on $g_{b\bar{b}H}$ feeds back into all other couplings via total width

Summary

- Determining the Higgs-boson couplings next step after discovery
Important for our understanding of electroweak symmetry breaking
- Independent of explicit realisation of new physics (if any):
Standard Model with effective Higgs couplings
- Problem of high-dimensional parameter space with correlated measurements
⇒ Dedicated tool: SFitter
- Obtain Standard Model couplings within errors for SM scenario
- Alternative solutions due to sign degeneracy of couplings
- Clear deviation for non-degenerate SPS1a-inspired scenario
- Analysis of errors on couplings
- Recent jet substructure analysis significantly improves result on bottom-quark coupling
- Influences accuracy of all other couplings via total width
